

# Performance Hero Success Guide

## Brother-Panther™ for DB2 LUW

Scott Hayes  
President & CEO, [DBI](#)  
IBM DB2 GOLD Consultant  
[Scott\\_Hayes@Database-Brothers.com](mailto:Scott_Hayes@Database-Brothers.com)

This page intentionally left blank.

# PATIENCE IS A VIRTUE

## Fully Optimized Performance Tuning requires *Patience* and *Discipline*

This paper describes the discipline. We cannot teach you patience, but we can hope you like to take coffee and lunch breaks.

## Introduction

This paper is not about the intimate details of product installation and configuration. It is assumed you have already read the product installation and configuration guide, successfully installed Brother-Panther's components, and possibly started collection for one or more databases.

**The purpose of this paper is to help you become a Performance Hero in your organization relatively quickly.** If you follow the steps and advice herein, it is highly likely that you will be very successful in achieving remarkable, measurable performance improvements in a short amount of time.

That being said, *patience is required*. In order to be extremely successful in database tuning, you must understand the database Statement workload and its aggregate costs. Workloads do not run instantly and they cannot be determined from snapshots or small windows of time. Workloads run over an extended period of time. The better you know the database Statement workload over an extended period of time, the more accurately you will be able to understand the workload's costs, and the more successful you will be at reducing costs of Statement execution. When you successfully reduce costs, database performance will improve resulting in faster query times, reduced CPU utilization, the ability to accommodate more users on the same hardware, or improved query throughput.

### ***Brother-Panther versus Brother-Eagle™***

Brother-Panther is designed to analyze database workloads over time. If you want or need to know “What’s happening right now?!?!?” then [Brother-Eagle](#) is the tool you should work with, for Brother-Eagle provides near real-time analysis of database performance metrics and drill downs to current activity and locks.

### ***Brother-Panther's Collection Discipline***

Brother-Panther works on the concept of collection windows or “intervals”. This is done for a few reasons:

- Minimize the overhead of monitoring
- Manage the size of the performance repository database
- Enforce discipline in the methods, management, and analysis of activity and history

Collection Intervals occur by default on 15 minute time boundaries beginning at the top of the hour, quarter past the hour, half past the hour, and three quarters past the hour.

Performance information is saved to the repository database approximately at the end of each 15 minute interval. Collection does not begin until the start time of a collection interval.

By way of example, then, let us assume that you use the DBI Admin Console to start collection for a database at 8:50am. Actual collection will begin at the top of the hour, or 9:00am. The first performance information will be loaded into the repository database around 9:15am. Therefore, the Brother-Panther Console will have its first information to present to you shortly after the first full collection interval, or around 9:16am or shortly thereafter.

If you selected Autonomic monitoring of Statement activity when you started database collection with the DBI Admin Console, the autonomic sensors begin checking key metrics during the first and subsequent collection intervals. It is possible, then, that Autonomic Statement collection may not begin until 9:15am, and the first Statement Performance would be available for viewing after 9:30am.

### ***OLTP Database Collection Recommendation***

For best results, the incredibly successful DBA should ideally allow collection to occur for a given OLTP database for at least an hour before diving in and attempting analysis and changes. This is not to say that an hour is required, but it is recommended.

### ***Data Warehouse Database Collection Recommendation***

For Data Warehouse databases, the best tuning results will be obtained after collecting performance data for several hours or a few days. Remarkably, even in seemingly Adhoc database environments, patterns of repetitious Statements often emerge as end users execute the same queries daily or weekly with same or different values in search arguments. It is for this reason that Brother-Panther provides the capability to analyze and aggregate Statement activity and costs over extended periods of time, such as an entire month, so that you can determine repetitious patterns of costly activity.

With this introduction behind us, and the mutual understanding of the importance and value of patience, we'll next take a look at the disciplined steps to becoming a Performance Hero in your organization.

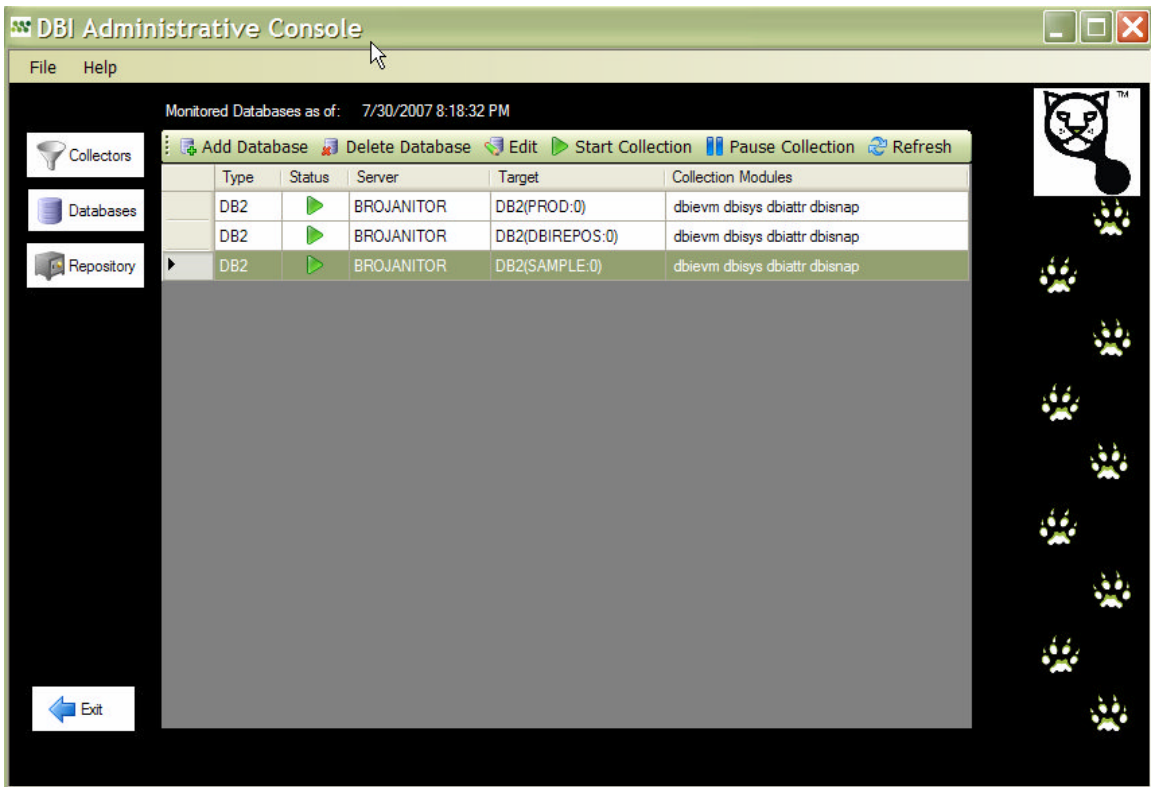

## Step 1: Start Collection

Use the DBI Admin Console to Start Collection on databases that are important to your organization. You can add several different databases hosted on the same or different database servers if you like. All databases that you monitor will appear in Brother-Panther's Console "Database Score" grid, which will allow you to see, at a glance, which databases have the most "opportunity for improvement" (that is, the lowest score, or the most problems).

DBI understands that some DBAs may not be interested in the performance of all databases, so each Brother-Panther user can set filter criteria to omit databases from the display which are not of interest.

After you have started collection, the Databases view of your DBI Admin Console might look similar to this:

You will note that 3 databases are being monitored on server BROJANITOR, instance DB2. One of the 3 databases is the DBI Repository. As the TV commercials say, "Do Not Attempt this at Home"

## Step 2: Take a Break

Get coffee.

Go to lunch.

Remember, patience is a virtue. The longer you collect performance data, the greater your chances for remarkable success.

## Step 3: Start the Brother-Panther Console

Click the Windows Start button, choose All Programs, choose Database-Brothers, and then choose “Brother-Panther DB2”. The Database Score grid should appear as shown below:

The screenshot shows the Brother-Panther console window titled "Brother-Panther(TM) - DBIREPOS@BROJANITOR:50000". The main area displays a "Database Score" grid with the following data:

Server	Instance	Database	Score	DB Type	#Parts	Stmt Collect Status	SQL Sync Read %	XML Sync Read %	IX Read Efficiency	Avg Result Size	DB Files Closed	Async Write %	Read Time (ms)	Write Time (ms)	SQL Async Read %	XML Async Read %	SQL Hit R
BROJANITOR	DB2	SAMPLE	9501	TP	1	N	100%	100%	0	1	0	0%	0	0	0%	0%	
BROJANITOR	DB2	PROD	7501	TP	1	F	100%	100%	30	1	0	0%	0	0	0%	0%	
BROJANITOR	DB2	DBIREPOS	6273	TP	1	N	100%	100%	2	1	0	0%	0	0	0%	0%	

Below the grid is a "Messages" log with the following entries:

Severity	When	Message	Source
OK	Mon, Jul 30 08:48:48 PM	DBIDNA2740001: Connected to: BROJANITOR:50000 PROD	System
OK	Mon, Jul 30 08:32:42 PM	Welcome to Brother-Panther Console	System

## Step 4: Check your Database Scores

Click on the “Score” column heading until the database performance grid sorts the database scores from lowest to highest.

Score
6273
7501
9501

Databases with the lowest scores have the most detected ‘opportunities for improvement’. 10,000 is the maximum score.

## Step 5: Check the Database Score Reports

Left click on the database name of a database having a score less than 10,000.

Database	Score ▲
DBIREPOS	6273
PROD	7501
SAMPLE	9501

Next, right click on that database name and select the option to Analyze DB Score:

Database	Score ▲	DB Type	# Parts	Str Coll Stat
DBIREPOS	6273	TP	1	
PROD	7501	TP	1	
SAMPLE				

- Partition Performance
- BufferPool Performance
- Tablespace Performance
- Table Performance
- Statement Performance
- View Performance Trends
- Analyze DB Score
- Execute SQL
- View DB2 Profile Variables
- Reports

The Database Score report will describe the analysis and factors that contributed to the Database Score. Some, but not all, Analysis messages are accompanied by Recommendations. Carefully review the Analysis and any Recommendations. The Database Score Report may provide you with advice or tips that will point you towards changes that will produce immediate, substantial, and measurable value.

For this particular database, the ratio of Rows Read to Rows Fetched (Index Read Efficiency, or IREF for short) is unreasonably high compared to industry expectations and best practices. The Recommendation suggests that indexes may be missing or sub-optimally defined.

**DB Score Analysis for PROD@BROJANITOR:DB2**

The following table contains an analysis of the overall performance score of the selected database. Each row represents a performance factor which contributed to the performance score that was computed for this database. You may click on any row to view its details in a separate dialog.

Analysis	Recommendation
This is an OLTP database since its average result set size is less than 10.	
The Index Read Efficiency (IREF) metric is too high for the type of database. This means that DB2 is doing too much reading of data pages to find result set rows and consuming unnecessarily high CPU time. Indexes are probably either missing or sub-optimally defined.	Look for missing or sub-optimally defined indexes.

Print Close

To learn more about IREF, consult the Brother-Panther documentation or Brother-Eagle's Expert Advice at <http://www.database-brothers.com/brother-eagle/advice/db2dbiref.php>.

Here is another sample Database Score Report:

**The following table contains an analysis of the overall performance score of the selected database. Each row represents a performance factor which contributed to the performance score that was computed for this database. You may click on any row to view its details in a separate dialog.**

Analysis	Recommendation
This is an OLTP database since its average result set size is less than 10.	
The database appears to be an OLTP database and there are tables with excessively high Rows Read, on average, per transaction (TBRRTX). When TBRRTX is too high, data scans are likely occurring due to missing or sub-optimal indexes. This is the number one most common problem that causes unnecessarily high CPU consumption and	Look for statements consuming high CPU with higher Index Read Efficiency (IREF) values, then improve the physical design by adding missing indexes or improving the cardinality of existing indexes.
The SQL Synchronous Read Percentage (SSRP) was undesirably low for. A low SSRP means that the database is doing too much scanning (via asynchronous prefetch I/O) instead of using optimized indexes or MQTs.	Look for opportunities to use optimized indexes or MQTs.
The SQL Overall Hit Ratio (SOHR) was undesirably low for the type of database.	Try to reduce scans or increase bufferpool sizes. However, also bear in mind that high bufferpool hit ratios can be falsely reassuring, for a 256MB table can easily be scanned in a 1GB bufferpool thus yielding a deceivngly high hit ratio.
The Index Read Efficiency (IREF) metric is too high for the type of database. This means that DB2 is doing too much reading of data pages to find result set rows and consuming unnecessarily high CPU time. Indexes are probably either missing or sub-optimally defined.	Look for missing or sub-optimally defined indexes.
Package Cache Hit Ratio (PKCHR) was found to be less than 90% for the database.	Increase the size of the database configuration package cache size, or try using DB2 9 autonomic tuning.

## Step 5: Check Table Performance

The most typical and fastest route to value is an examination of Table Performance. Table Performance will show us tables with the highest Rows Read or Rows Written, along with other potential problems such as unusually high Rows Read per Transaction or Overflows.

Right click on the database name again (PROD), and then select the option Table Performance:

Database	Score ▲	DB Type	# Parts	S C S
DBIREPOS	6273	TP	1	
PROD	2504	TP	1	
SAMPLE				

- Partition Performance
- BufferPool Performance
- Tablespace Performance
- Table Performance**
- Statement Performance
- View Performance Trends
- Analyze DB Score

You will see a Table Performance grid like this example:

Brother-Panther(TM) - DBIREPOS@BROJANITOR:50000

Database Score Table Performance for PROD@...

Ready

Click on the “Rows Read” column until the grid is sorted in descending sequence; the tables with the highest Rows Read will appear at the top.

Generally, Rows Read per Transaction shouldn’t exceed the value of 10. Here, the table DGIPROD.DGI\_WEB\_LOGS\_TB has had over 915,000,000 Rows Read with Rows Read per Transaction of 1,217. When Rows Read per Transaction exceeds 10, it usually means that scans are occurring against the table data - which means that indexes are missing or sub-optimally defined.

## Step 6: Find the Statement Activity causing High Rows Read

Right click on the table name of a table having the highest Rows Read or Rows Read/TX counts, and choose the option “Statement Performance”:

Schema	Table	Size (MB)	Rows Read	Rows Read/Tx	Rows Read/Sec
DGIPROD	DGI_WEB_LOGS_TB	110	915000000	1237	78354
DB2V82	EMPLOYEE			1	90
SYSTOOLS	HMON_ATM			0	0
SYSIBM	SYSTABLES			0	0
SYSIBM	SYSRROUTIN			0	0
DB2V82	SALES			0	0
SYSIBM	SYSCOLUMNS			0	0
SYSIBM	SYSINDEXES			0	0
SYSIBM	SYSTRIGGERS			0	0

A Statement Performance grid will be displayed which shows the Statement activity that is driving I/O to the selected table. From the Table Performance grid, it is important to understand that Statement Performance shows all Statements driving I/O to the table, but other Statements are filtered out. This analysis is INVALUABLE to physical design and the determination of indexes, clustering indexes, MDC tables, and MQTs.

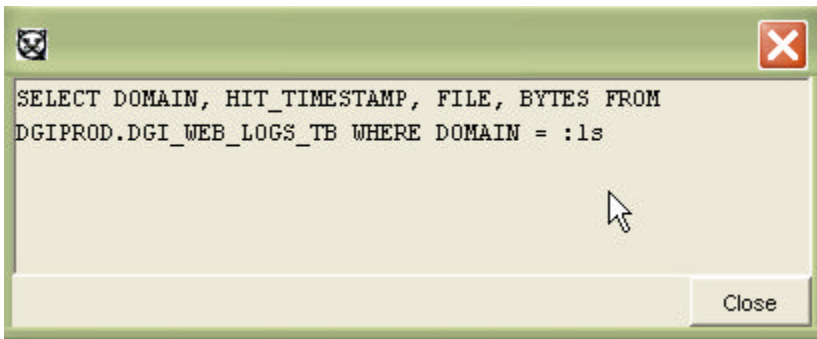

Statement Performance for PROD@BROJANITOR:DB2 -> Table DGIPROD.DGI_WEB_LOGS_TB																	
Statement Workload from 7/30/07 8:40 PM to 7/30/07 11:40 PM

The Statement text will be shown in a pop-up window:

Statement text in this window can be copied and pasted into other windows such as Email or Word or Brother-Panther’s Execute SQL feature.

### Step 7b: Try the “Tune SQL” option

The Tune SQL option for a Statement will provide the Statement text, the properties of the Compilation environment, describe high cost steps of the Statement’s internal execution, and show alternatives.

Stmt ID	Verb	Type	# Execs	CPU Time (sec)	% CPU Time	IX Read Efficiency	
24221CFA...	SELI			28125	36%	205365	
4F398AD8...	SELI			87500	26%	135136	
0DB2CA4F...	SELI			96875	15%	175013	
B7B8222E...	SELI			62500	12%		1
8D8741C0...	SELI			37500	5%	175590	
B43F9D70...	SELI			00000	5%	175590	
D037A2D2...	SELI			56250	0%		0

Sample Tune SQL display:

Alternatives	Name	Explain Total Cost	Rows Selected	Rows Read	Rows Written	Rows Deleted	Rows Inserted	Rows Updated
Baseline		39,171.67						
Alternative-1		39,171.67						

High Cost Steps	ID	Description
	1130	Application Data types should match host variable types and lengths.
	2000	A TABLE SCAN (21657 pages) is performed on DGIPROD.DGI_WEB_LOGS_TB.

```
Statement
SELECT DOMAIN, HIT_TIMESTAMP, FILE, BYTES FROM
DGIPROD.DGI_WEB_LOGS_TB WHERE DOMAIN = :1s

Properties
Optimizer Class: 5
Statement Text Changed: No
Object Statistics Changed: No
Virtual Index Evaluated: None
```

From this window, you can easily complete the next step which is to examine an Explain Plan View, or “Explain” the Statement. Click the Explain Plan View icon:

Alternatives	Name	Explain Total Cost	Rows Selected	Rows Read	Rows Written	Rows Deleted
Baseline		39,171.67				
Alternative-1		39,171.67				

Also from this Tune SQL window you can easily obtain physical design analysis from the IBM Design Advisor:

Alternatives	Name	Explain Total Cost	Rows Selected	Rows Read	Rows Written	Rows Deleted	Rows Inserted	Rows Updated
Baseline		39,171.67						
Alternative-1		39,171.67						

## Step 7c: Review Explain

Again, from the Statement Performance grid, Right Click on a row having a disproportionately high execution cost, and select the option “Explain SQL” (You could, of course, have clicked the Explain icon in the previous step):

Verb	Type	# Execs	CPU Time (sec)	% CPU Time	IX Read Efficiency	Sort Time (ms)
SELECT	DYNAMIC	1196	146.328125	36%	205365	0
SELECT			7500	26%	135136	0
SELECT			5875	15%	175013	0
SELECT			2500	12%	1	0
SELECT			7500	5%	175590	0
SELECT			10000	5%	175590	0
SELECT			5250	0%	0	0

View Statement

Database Score | Table Performance for PROD@B... | Statement Performance for PRO... | Tune: SQL - BROJANITOR:5000... | Explain: SQL - BROJANITOR:50...

In one convenient window, you will find the Statement text, a graphical representation of the Explain plan, a summary of the compilation environment, statistics about the Table(s) involved, definitions and statistics for indexes on the table(s), and a description of the table definition, its columns, and their statistics. Talk about one-stop shopping. This Explain Analysis brings it all together.

## Step 7d: Design Analysis

Again, from the Statement Performance grid, Right Click on a row having a disproportionately high execution cost, and select the option “Design Analysis” (You could, of course, have clicked the Design Analysis icon in step 7b):

Verb	Type	#Execs	CPU Time (sec)	% CPU Time	IX Read Efficiency	Sort Time (ms)
SELECT	DYNAMIC	1186	146.328125	36%	205365	0
SELECT			500	26%	135136	0
SELECT			875	15%	175013	0
SELECT			500	12%	1	0
SELECT			500	5%	175590	0
SELECT			000	5%	175590	0
SELECT			250	0%	0	0

A Design Analysis option window will appear similar to this one:

**Design Analysis Profile Settings**

Name: Design Analysis 2007-07-31 01:06:47.296

Remarks: I am going to be a hero

Design Advice:

- Multi-Dimensional Clustering (MDC)
- Materialized Query Tables (MGT)
- Partition Keys

Public Profile

Last Save Time:

Last Executed:

Execution Settings:

Workload Name: DBI\_Analysis\_Workload

Maximum Time for Analysis (min): 5

Maximum Disk for Indexes (MB):

Preserve in Database:

- Workload
- Explain Plans
- Recommended Indexes

Buttons: Run, Modify Workload, Cancel, Help

1. Add Remarks for documentation: “I am going to be a hero”
2. Check the MDC and MQT Design Advice boxes if you are seeking Design Advice for more than one statement (these boxes really shouldn’t be checked, but this is an example). Index advice will always be provided by default. You might select Partition Keys advice if your database has multiple partitions.
3. Give the Workload a Name: “DBI\_Analysis\_Workload”
4. Optionally provide a time limit for the analysis
5. Optionally provide a maximum amount of disk storage for proposed indexes (MB)
6. Check the Preserve in Database options as you see fit
7. **Click Run** to get Design Advice for the Statement selected earlier

A window similar to the one below will appear:

```
--
-- LIST OF RECOMMENDED INDEXES
--
-----
-- index[1], 0.013MB
CREATE INDEX "DB2V82"."IDX707310629400000" ON "DB2V82"."EMPLOYEE" ("FIRSTNAME" ASC, "HIREDAT
COMMIT WORK ;
RUNSTATS ON TABLE "DB2V82"."EMPLOYEE" FOR INDEX "DB2V82"."IDX707310629400000";
COMMIT WORK ;
```

Table Schema	Table Name	Index Name	Index Columns
DB2V82	EMPLOYEE	IDX7073106...	+FIRSTNAME+HIREDATE+SALARY+BONUS+COMM+SEX+LASTNAME+EMPNO

The top left pane contains the output from the IBM Design Advisor. The bottom pane contains a summary of proposed indexes.

The astute reader may notice that I have sought design advice for a different statement which accesses a different table for purposes of illustrating the procedure and Brother-Panther’s capabilities. You may also note that the IBM Design Advisor highly favors composite (multi-column) indexes so that Index Only Access can be achieved. The user is encouraged to exercise reasonable prudence when implementing Design Advisor recommendations - in other words, compare the WHERE predicates of the SQL to the columns in the proposed index; it may be appropriate to create a new index using only the first one or two columns of the Design Advisor’s recommendation.

Any text from the top left pane can be copied and pasted into Brother-Panther's "Execute SQL" function as an alternative method of creating new indexes or implementing other physical design changes. This alternate method would allow you to give any new indexes descriptive names of your choosing, rather than accepting the IBM generated gibberish names.

## ***Step 7e: Implement Physical Design Improvement***

From the Design Analysis window, you can easily create any recommended new index by Right Clicking on the index name and selecting the "Create" option. This will load and nicely format the CREATE INDEX statement into Brother-Panther's "Execute SQL" function. Here you can edit the CREATE INDEX command prior to running it. Be sure to:

1. Give the new Index a name that is descriptive and which conforms to your shop standards
2. Remove any extra or unnecessary columns from the index definition if the Design Advisor has become over zealous in its aggressive pursuit of Index Only access.

After your edits, if any, are complete, simply click the green "play" (right arrow) button at the top left to run the CREATE INDEX command (optionally followed by RUNSTATS)

.

## **Step 8: Take a Break**

You deserve it.

Get some coffee or a brand name cola.

Take a peer to lunch and brag about how easy it was for you to find performance problems in the database, and fix them with just a couple mouse clicks.

Remember, patience is a virtue.

## Step 9: Review Performance Trends

Return to the Database Score grid, Right Click on a Database name, and select the option “View Performance Trends”:

Database	Score ▲	DB Type	# Parts	Stmt Collect Status	SQL Sync Read %	XML Sync Read %	IX Read Efficiency	A S
PROD	888	ms	1	F	100%	100%	26	
SAMPLE				N	100%	100%	4	
DBIREPC				N	100%	100%	5	

Partition Performance
BufferPool Performance
Tablespace Performance
Table Performance
Statement Performance
<b>View Performance Trends</b>
Analyze DB Score

Another window will appear that provides you with several charting options. You can choose from bar or line charts, the time scale of the charts (hours, days, or months), the metrics to graph, and a time range for the graph:

**Chart Settings**

**Chart Definition**

- DB Score
- TX Costs
- Time
- Rates**
- Ratios
- Counts
- Percentage

IX Read Efficiency  
Phys Reads/Sec  
Async Pg Reads/Req  
Tx/Sec  
SQL/Sec

**Chart Type**

line  
 bar

**Time Range**

Start: 7/30/07 3:23 PM  
End: 7/31/07 2:35 AM

**Time Scale**

hours  
 days  
 months

OK Cancel

Click the OK button after you have made your trend graph option selections, and a graph window will appear:

You will note that some metrics graph better together than others depending on the scale of values.

To verify the success of your tuning changes from Step 7, or any other configuration or physical design changes for that matter, some of the best metrics to graph include:

Category	Metric	Desired Movement
DB Score	Score	Higher is Better
TX Costs	Sorts/TX	Lower is Better
TX Costs	Hash Joins/TX	Lower is Better
TX Costs	Logical IX Reads/TX	Lower is Better
TX Costs	Logical Reads/TX	Lower is Better
Time	All Metrics	Lower is Better
Rates	Index Read Efficiency	Lower is Better
Rates	TX/Sec	Higher is Better
Rates	SQL/Sec	Higher is Better
Ratios	All	Higher is Better
Percentages	SQL Sync Read %	Higher is Better
Percentages	XML Sync Read %	Higher is Better
Percentages	Async Write %	Higher is Better
Percentages	Sort Ovflo %	Lower is Better
Percentages	% CPU Busy	Lower is Better

## Step 10: Share your Success

To become a DBI Certified Performance Hero, send screen shots of performance trend graphs indicating improvements, or screen shots of grids indicating performance improvements, to [hero@database-brothers.com](mailto:hero@database-brothers.com) along with your contact information and a short essay description of the steps you took and the results you achieved. Someone from DBI will contact you to review your achievements and make arrangements to send you your DBI Certified Performance Hero award kit.

And, of course, it goes without saying, but it would be prudent to repeat steps 1-9 repeatedly until no further tuning improvements can be obtained. Also be sure to explore all of the features and capabilities of Brother-Panther; only a fraction of its functionality has been covered by this introductory guide.

## Summary

Brother-Panther is a robust product with many features and capabilities. Please read the product documentation completely. As you explore all of the capabilities of the product, you will discover many ways that Brother-Panther can help you administrate your databases and improve and sustain excellent database performance.

Here's a quick list of additional functionality and tuning suggestions:

- Review Partition performance in a multi-partition database to ensure the load is appropriately balanced across partitions
- Review Bufferpool Performance; tune to improve hit ratios and reduce physical I/Os
- Review Tablespace Performance; tune to improve read and write times and asynchronous pages read per request
- Review Table Performance; look for tables that need to be reorganized (high Overflows), and don't forget the catalog tables
- Review Table Performance; for tables having the highest Rows Written, carefully review index definitions to ensure there are no indexes with low cardinalities or skew
- Repeatedly review Statement Performance and work to reduce the relative execution costs of costly Statements
- Monitor Performance Trends over Time
- Explore the DBI Repository Database; it is well documented with many comments - you may find additional information there that is helpful to you
